

**SUMMARY OF HYDROLOGIC CONDITIONS
IN THE
UPPER DELAWARE RIVER BASIN
July 2006**

Prepared by the
Office of the Delaware River Master
Milford, Pennsylvania

Adjusted streamflow in the upper Delaware River Basin during July was excessive. The maximum daily mean discharge of 39,500 cfs was recorded on July 1. The minimum daily mean discharge was 2,540 cfs on July 30.

The observed monthly mean streamflow of the Delaware River at Montague, N.J. during July was 7,582 cfs, which is 310 percent of median. The flow at Montague, adjusted for diversions from the basin and change in storage in the major reservoirs, was 6,750 cfs, or 295 percent of median (water years 1971-2000).

On the basis of an 11-station average, precipitation during July was 3.16 inches, which is 78 percent of the 65-year average. The maximum daily-average precipitation during the month was 1.08 inches on July 23. Precipitation in the upper Delaware River Basin during the past 12 months was 9.70 inches more than the long-term average. Precipitation during July was 0.90 inches less than the long-term average for the month.

Combined storage August 1, 2006 in Pepacton, Cannonsville, and Neversink Reservoirs was 97 percent of capacity above the point of maximum depletion. The combined storage of 262 billion gallons was 17 billion gallons less than that of one month ago and 49 billion gallons more than that of one year ago. Median storage on the first day of August in 39 years of record is 230 billion gallons. Pepacton, Cannonsville, and Neversink Reservoirs spilled 8.9, 17.6, and 1.0 billion gallons, respectively, in July.

As part of statewide networks, the USGS operates ground-water observation wells in the Pennsylvania and New Jersey parts of the Delaware River Basin. Mean water levels during July were above average in 19 of 20 observation wells. Water levels in 15 of 20 wells were above June 2006 levels, and water levels in 16 of 20 wells were above July 2005 levels.

HYDROLOGIC CONDITIONS IN THE UPPER DELAWARE RIVER BASIN
